

WEEK-9- Implementation of Elastic Load Balancer with Auto Scaling using AWS EC2 Instances.

Elastic Load Balancer (ALB)

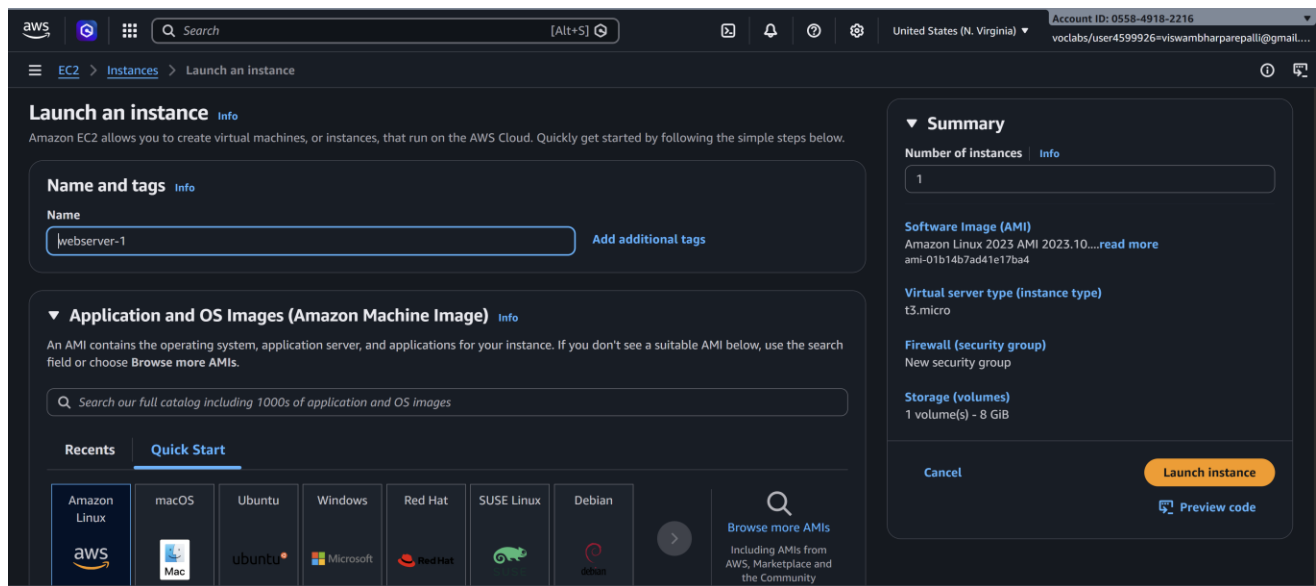

STEPS:

1. **Launch Two EC2 Instances**
2. **Create a Load Balancer**
3. **Verify Load Balancer**
4. **Optional – Test Health Checks**

Step 1: Launch Two EC2 Instances

1.1 Launch EC2 Instance #1

1. Go to **AWS EC2 Console** → **Launch Instance**.
2. **Name:** webserver-1

- 3.
4. Choose an **AMI** (Amazon Linux 2).
5. Select **Instance Type** (e.g., t2.micro).
5. Add **Storage** (default is fine).

6. Configure **Security Group**:

- Allow **SSH (22)** from your IP
- Allow **HTTP (80)** from anywhere (0.0.0.0/0)

7. **Launch** → Select/Create Key Pair → Launch.

8.

Run these commands after connecting VM

Sudo su

yum update -y

yum install httpd -y

systemctl start httpd

systemctl enable httpd

echo "This is Server 1" > /var/www/html/index.html

```
Verifying : apr-1.7.5-1.amzn2023.0.4.x86_64

Verifying : mod_lua-2.4.66-1.amzn2023.0.1.x86_64

Installed:
apr-1.7.5-1.amzn2023.0.4.x86_64      apr-util-1.6.3-1.amzn2023.0.2.x86_64      apr-util-lmdb-1.6.3-1.amzn2023.0.2.x86_64
apr-util-openssl-1.6.3-1.amzn2023.0.2.x86_64      generic-logos-httpd-18.0.0-12.amzn2023.0.3.noarch      httpd-2.4.66-1.amzn2023.0.1.x86_64
httpd-core-2.4.66-1.amzn2023.0.1.x86_64      httpd-filesystem-2.4.66-1.amzn2023.0.1.noarch      httpd-tools-2.4.66-1.amzn2023.0.1.x86_64
libbrotli-1.0.9-4.amzn2023.0.2.x86_64      mailcap-2.1.49-3.amzn2023.0.3.noarch      mod_http2-2.0.27-1.amzn2023.0.3.x86_64
mod_lua-2.4.66-1.amzn2023.0.1.x86_64

Complete!
[root@ip-172-31-73-87 ec2-user]# systemctl start httpd
[root@ip-172-31-73-87 ec2-user]# systemctl enable httpd
Created symlink /etc/systemd/system/multi-user.target.wants/httpd.service → /usr/lib/systemd/system/httpd.service.
[root@ip-172-31-73-87 ec2-user]# echo "This is Server 1" > /var/www/html/index.html
[root@ip-172-31-73-87 ec2-user]#
```

✓ Now you create second **EC2 instances** running Apache, with message **This is Servier 2** each serving a simple web page.

Repeat it for second instance

Sudo su //to move to root user

yum update -y //Updates all installed packages to the latest versions

yum install httpd -y //installs the Apache HTTP Server on your EC2 instance.

systemctl start httpd //starts the Apache web server on your EC2 instance.

systemctl enable httpd //ensures that the Apache web server starts automatically whenever the system (EC2 instance) reboots.

echo "This is Server 2" > /var/www/html/index.html //It creates or replaces the homepage with given msg

```

```

Step 2: Create a Load Balancer

AWS provides **Elastic Load Balancer (ELB)**. We will create an **Application Load Balancer (ALB)**.

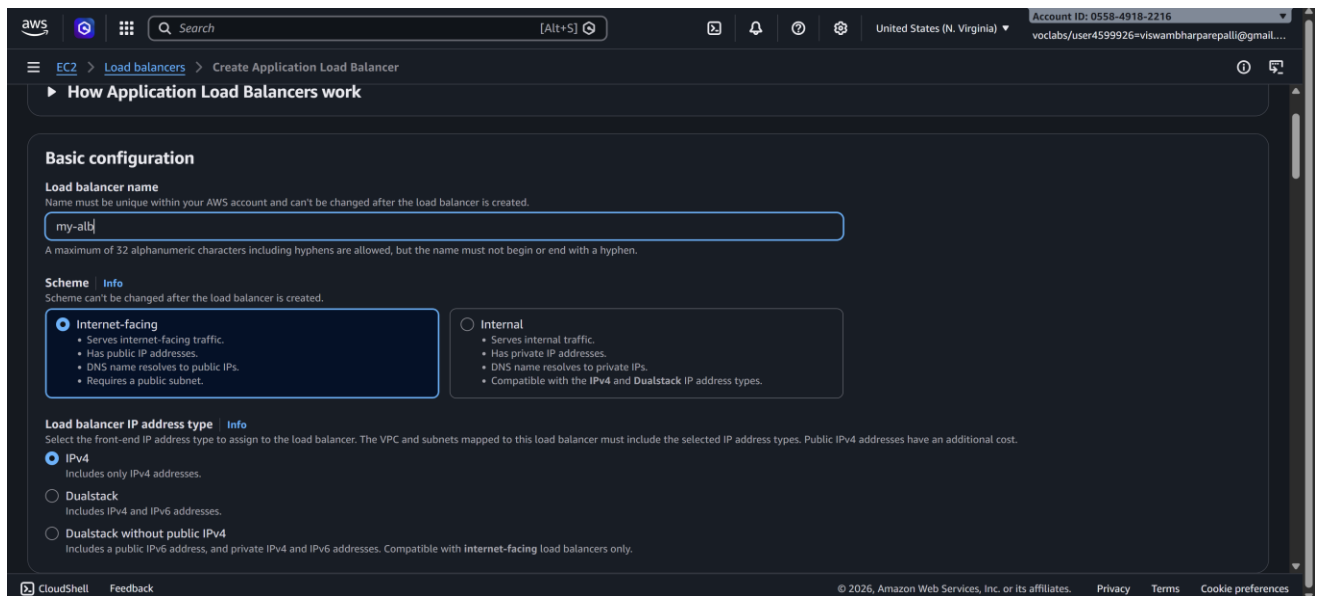

2.1 Configure Security Group for Load Balancer

- Go to **EC2 → Security Groups → Create Security Group**
 - Name: lb-sg
 - Allow **HTTP (80)** from anywhere
 - Optional: **HTTPS (443)** if using SSL

2.2 Create the Load Balancer

1. Go to **EC2 → Load Balancers → Create Load Balancer → Application Load Balancer**
2. **Basic Configuration:**
 - Name: my-alb
 - Scheme: Internet-facing
 - IP address type: IPv4
3. **Listeners:**
 - Default: HTTP (80)

2.3 Configure Availability Zones

- Select the default **VPC** where your EC2 instances exist
- Select **two /all subnets** (one for each instance if possible)

2.4 Configure Security Groups

- Choose the **lb-sg** security group created earlier

2.5 Configure Target Groups

1. Create a new target group:

- Name: web-servers-tg
- Target type: Instance
- Protocol: HTTP
- Port: 80
- Health checks: / (default)

The screenshot shows the AWS Management Console interface for creating a new target group. The breadcrumb navigation at the top indicates the path: EC2 > Target groups > Create target group. The main form is titled 'Create target group' and contains several sections:

- targets.**: A dropdown menu set to 'HTTP' and a text input field for 'Individual targets during registration' with the value '80' and a '1-65535' range indicator.
- IP address type**: A section with the instruction 'Only targets with the indicated IP address type can be registered to this target group.' It has two radio button options:
 - IPv4** (selected): 'Each instance has a default network interface (eth0) that is assigned the primary private IPv4 address. The instance's primary private IPv4 address is the one that will be applied to the target.'
 - IPv6**: 'Each instance you register must have an assigned primary IPv6 address. This is configured on the instance's default network interface (eth0). [Learn more](#)
- VPC**: A section with the instruction 'Select the VPC with the instances that you want to include in the target group. Only VPCs that support the IP address type selected above are available in this list.' It features a dropdown menu showing 'vpc-023fdd5a5e0711563' with a '(default)' label and a 'Create VPC' button.
- Protocol version**: A section with three radio button options:
 - HTTP1** (selected): 'Send requests to targets using HTTP/1.1. Supported when the request protocol is HTTP/1.1 or HTTP/2.'
 - HTTP2**: 'Send requests to targets using HTTP/2. Supported when the request protocol is HTTP/2 or gRPC, but gRPC-specific features are not available.'
 - gRPC**: 'Send requests to targets using gRPC. Supported when the request protocol is gRPC.'

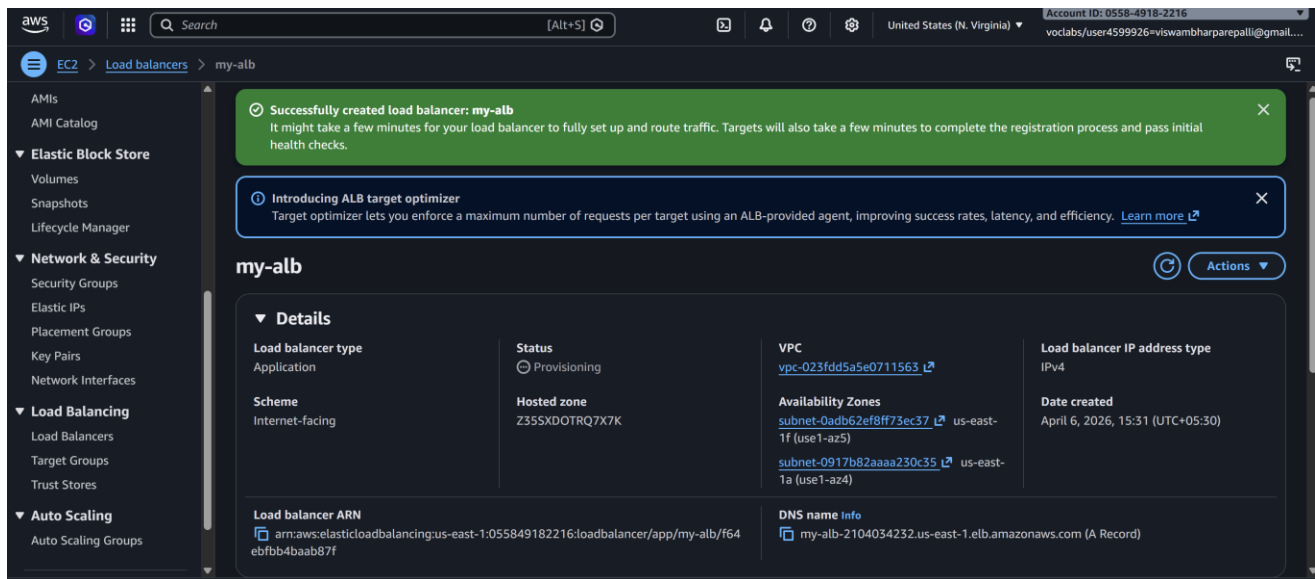

2. Register Targets:

- Select EC2 INSTANCES HERE --- **webserver-1** and **webserver-2**
- Click **Include as pending** → **Register**

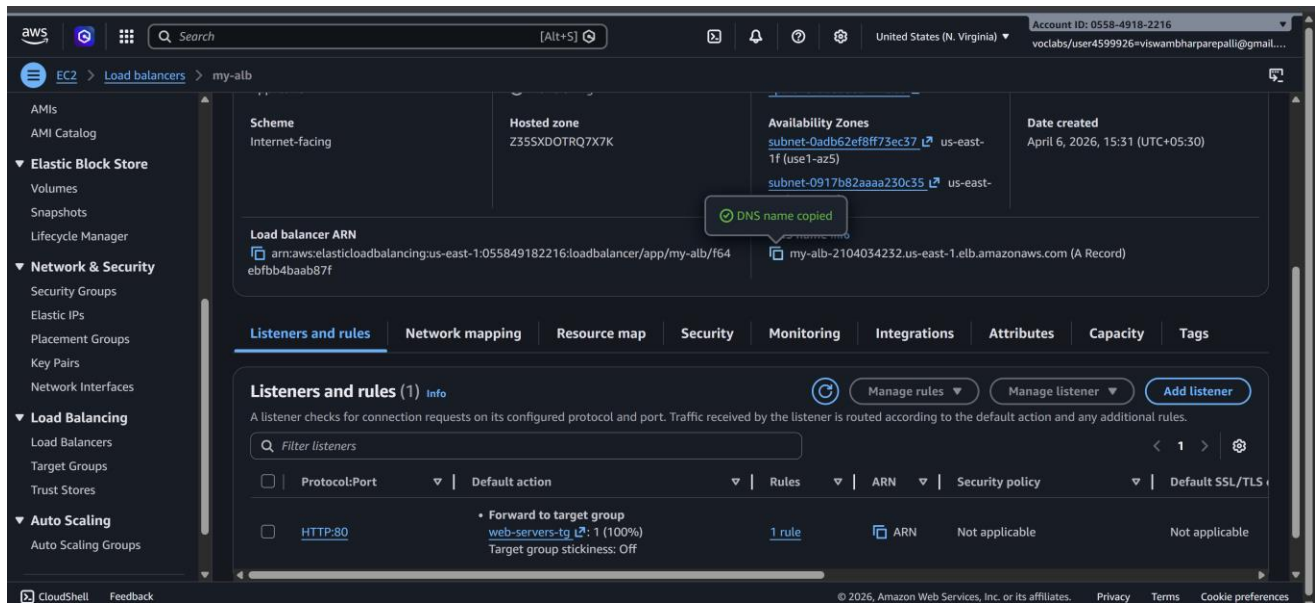

2.6 Review and Create

- Review all settings → Click **Create Load Balancer**
- AWS will take a few minutes to provision the ALB

Step 3: Verify Load Balancer

1. Go to **Load Balancers** → **Select ALB** → **Description** → **DNS name**
2. Copy the **DNS name** (something like my-alb-123456.us-east-1.elb.amazonaws.com)

- 3.
4. Paste it in a browser → You should see either **WebServer-1** or **WebServer-2** page.
 - Refresh multiple times → Load balancer distributes traffic between the two instances

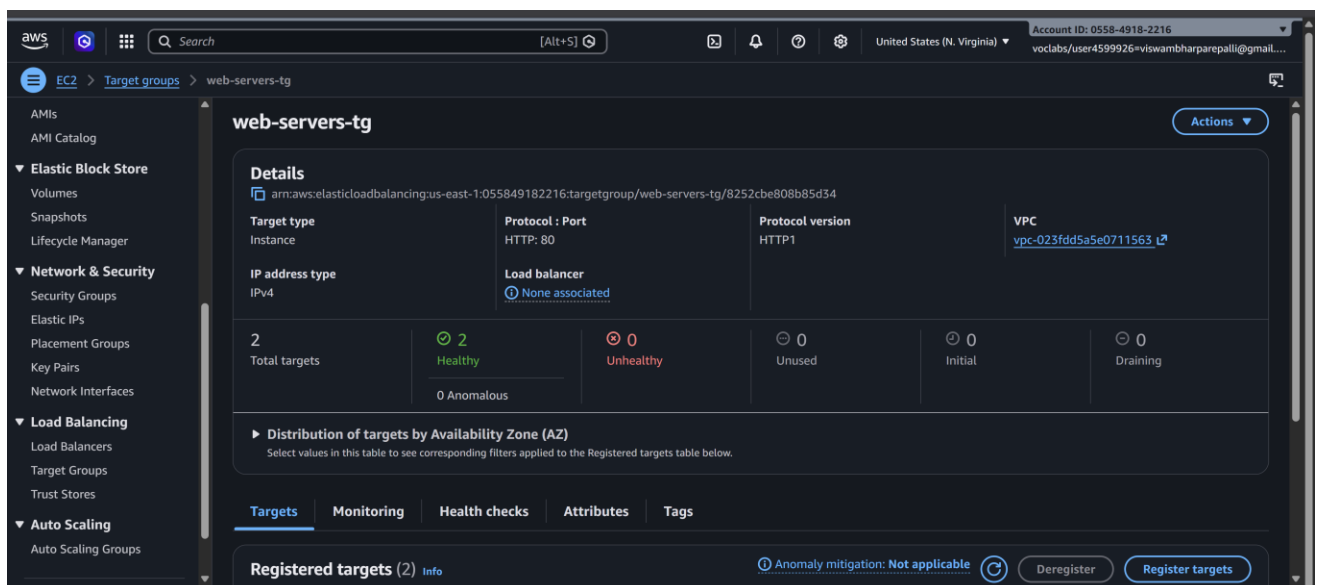

This is Server 2

Step 4: Optional – Test Health Checks

- Go to **Target Groups** → **web-servers-tg** → **Targets**
- Ensure **Status** of both instances is healthy

If a server is unhealthy, check the bootstrapping script or security group rules.

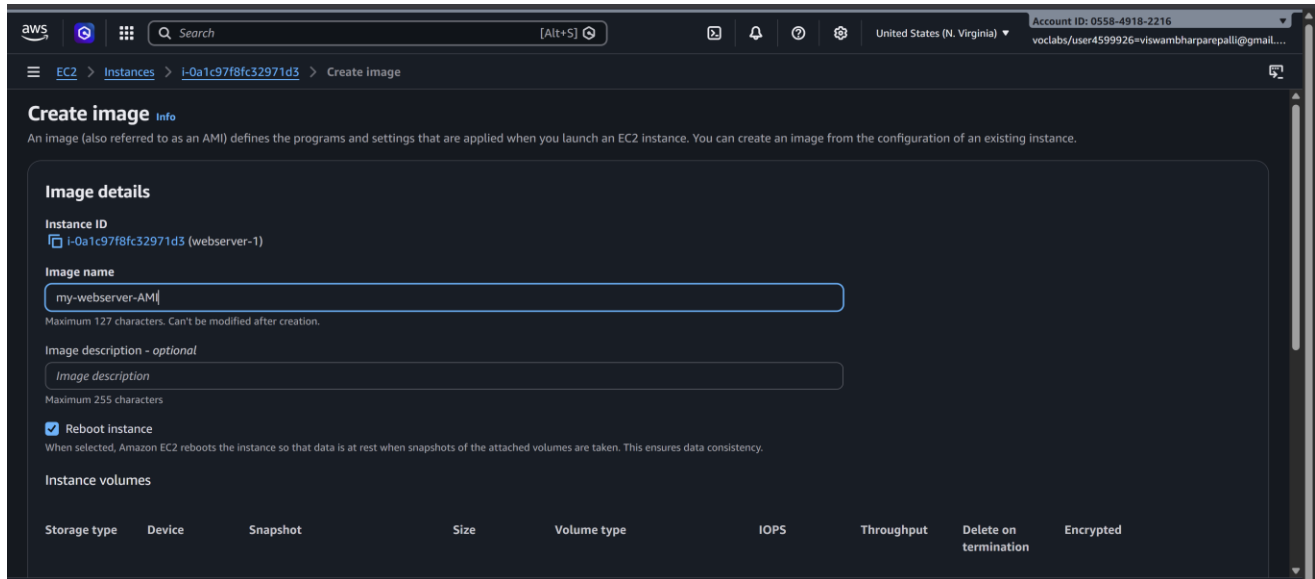

Step-by-Step: Auto Scaling Group with Load Balancer

- 1. Create an AMI from Existing EC2 Instance**
- 2. Create a Launch Template**
- 3. Create Auto Scaling Group (ASG)**
- 4. Network Settings**
- 5. Configure Group Size**
- 6. Review and Create ASG**
- 7. Verify Load Balancer and Auto Scaling**
- 8. Test Load Balancer**

Step 1: Create an AMI from Existing EC2 Instance

1. Go to **EC2 Console** → **Instances**
2. Select the EC2 instance you already configured with bootstrapping
3. Click **Actions** → **Image and Templates** → **Create Image**
4. **Provide Image Name:** e.g., my-webserver-AMI
5. Optional: Add description
6. Click **Create Image**

- Wait for the AMI to become **available** (status: available in **AMIs** section)

8.

- ✓ This AMI will be used for launching new instances automatically in ASG.

Step 2: Create a Launch Template

- Go to **EC2** → **instances->Launch Templates** → **Create Launch Template**
- Launch Template Name:** my-launch-template

Launch template name and description

Launch template name - *required*

 Must be unique to this account. Max 128 chars. No spaces or special characters like '&', '*', '@'.

Template version description

 Max 255 chars

Auto Scaling guidance | [Info](#)
 Select this if you intend to use this template with EC2 Auto Scaling
☐ Provide guidance to help me set up a template that I can use with EC2 Auto Scaling

▶ **Template tags**
 ▶ **Source template**

Launch template contents
 Specify the details of your launch template below. Leaving a field blank will result in the field not being included in the launch template.

▼ **Application and OS Images (Amazon Machine Image)** | [Info](#)
 An AMI contains the operating system, application server, and applications for your instance. If you don't see a suitable AMI below, use the search

Summary

Software Image (AMI)
 my-webserver-AMI
 ami-0228f617cce9923f

Virtual server type (instance type)
 -

Firewall (security group)
 -

Storage (volumes)
 1 volume(s) - 8 GiB

[Cancel](#) [Create launch template](#)

- 3.
4. **AMI:** Select the AMI created in Step 1 (my-webserver-AMI)
5. **Instance Type:** t2.micro (or your choice)
6. **Key Pair:** Select your existing key pair
7. **Security Groups:** Select the **Load Balancer Security Group** (allow HTTP 80)
8. **User Data:** Optional (already baked into AMI)
9. Click **Create Launch Template**

Key pair name
 [Create new key pair](#)

▼ **Network settings** | [Info](#)

Subnet | [Info](#)
 [Create new subnet](#)

When you specify a subnet, a network interface is automatically added to your template.

Availability Zone | [Info](#)
 [Enable additional zones](#)

Firewall (security groups) | [Info](#)
 A security group is a set of firewall rules that control the traffic for your instance. Add rules to allow specific traffic to reach your instance.
☒ Select existing security group ☐ Create security group

Security groups | [Info](#)
 [Compare security group rules](#)
 lb-sg sg-019038a5128a581c9 [X](#)
 VPC: vpc-023fdd5a5e0711563

▶ **Advanced network configuration**

Summary

Software Image (AMI)
 my-webserver-AMI
 ami-0228f617cce9923f

Virtual server type (instance type)
 t2.micro

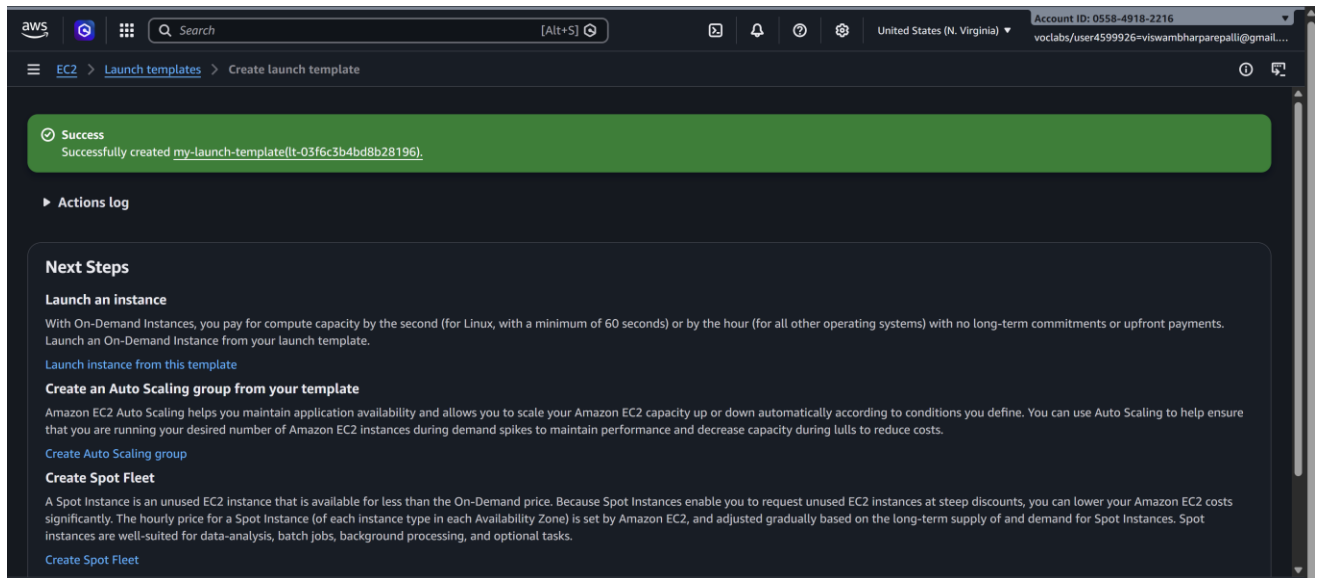

Firewall (security group)
 lb-sg

Storage (volumes)
 1 volume(s) - 8 GiB

[Cancel](#) [Create launch template](#)

10.

✓ Launch Template is ready for Auto Scaling.

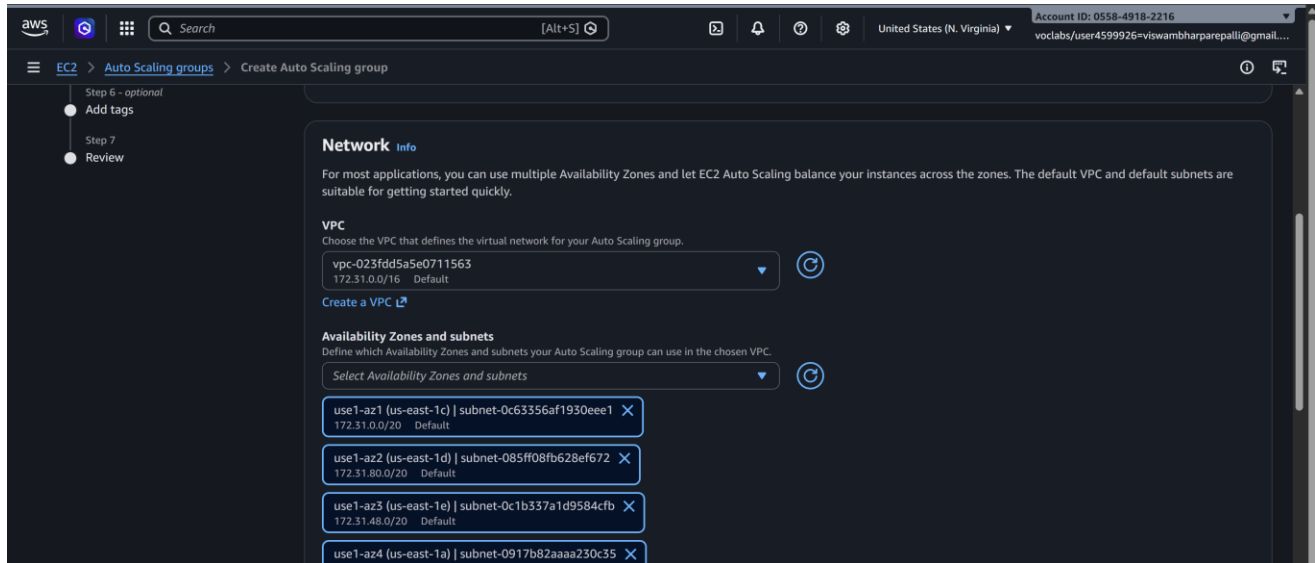

Step 3: Create Auto Scaling Group (ASG)

1. Go to **EC2** → **Auto Scaling Groups** → **Create Auto Scaling Group**
2. **Name:** webserver-asg
3. **Launch Template:** Select my-launch-template
4. **Template Version:** Select **Version 1**
5. Click **Next**

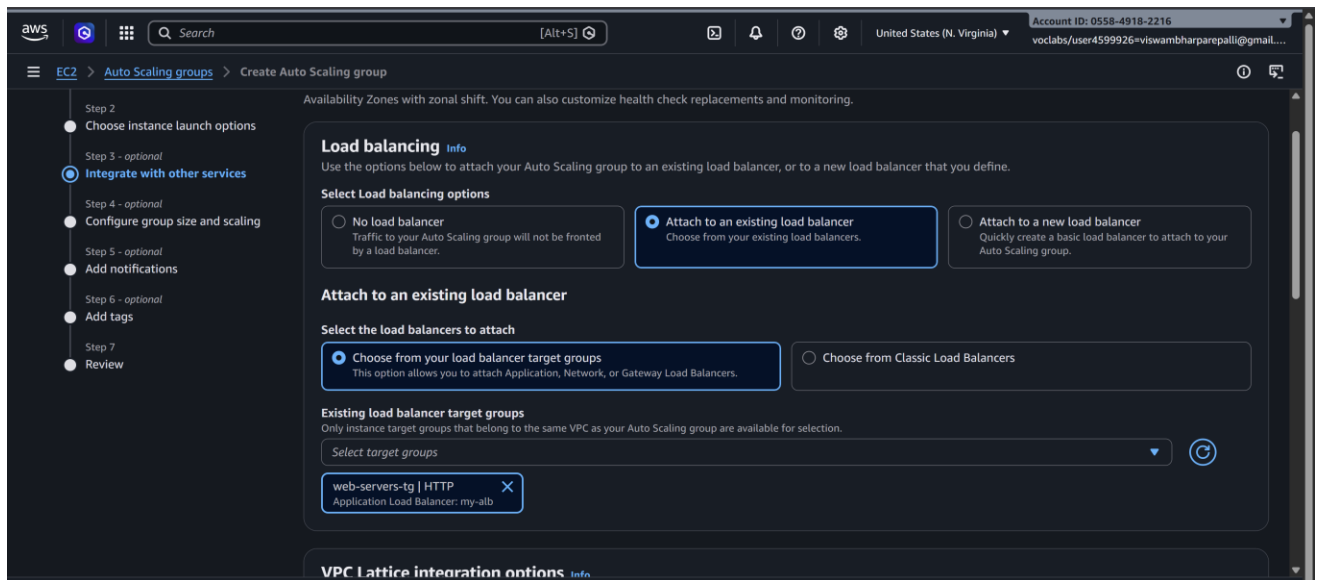

Step 3.1: Network Settings

1. **VPC:** Default VPC (or your existing VPC)
2. **Availability Zones (AZs):** Select **all** subnets (for high availability)

- 3.
4. **Load Balancer:** Enable **Attach to an existing load balancer**
 - Select your **existing Load Balancer**

5. **Health Check:** HTTP
 - Set **Health Check Grace Period:** 300 seconds

6. Click **Next**

Step 3.2: Configure Group Size

1. **Desired Capacity:** 2 (initial instances)
2. **Minimum Capacity:** 1
3. **Maximum Capacity:** 4
4. Click **Next**

5.

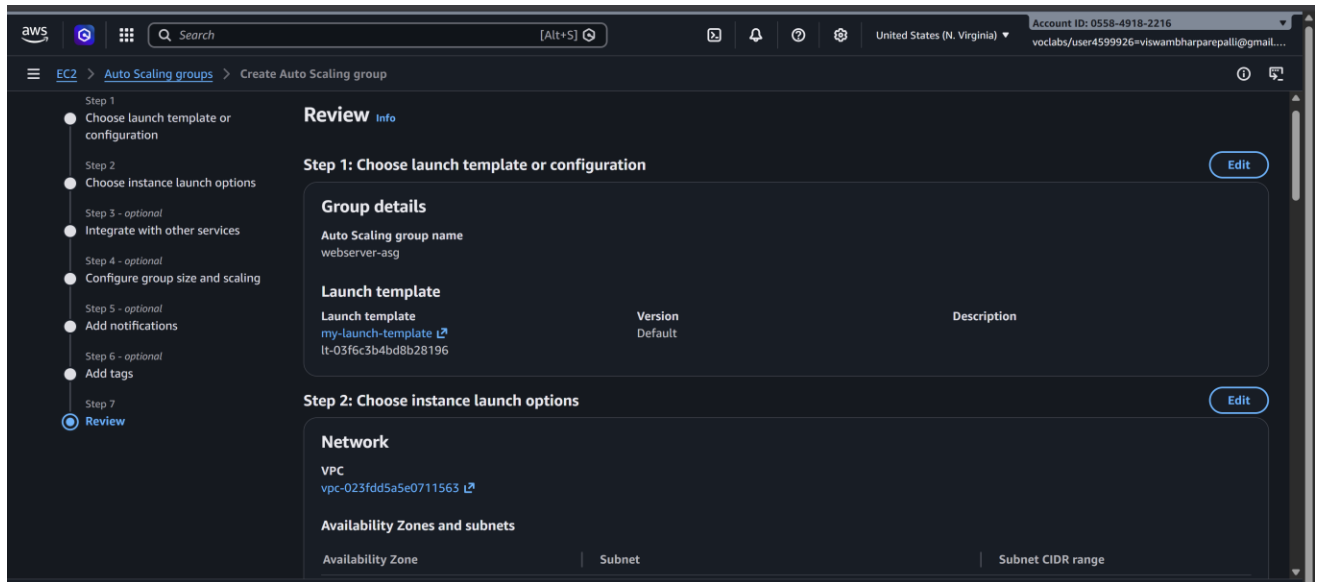

The screenshot shows the AWS Management Console interface for creating an Auto Scaling group. The left sidebar displays a progress bar with seven steps: 1. Choose instance launch options, 2. Integrate with other services, 3. Add notifications, 4. Configure group size and scaling (selected), 5. Add tags, 6. Review, and 7. Review. The main content area is titled 'Create Auto Scaling group' and contains the following sections:

- Group size** (Info icon): Set the initial size of the Auto Scaling group. After creating the group, you can change its size to meet demand, either manually or by using automatic scaling.
- Desired capacity type** (Info icon): Choose the unit of measurement for the desired capacity value. vCPUs and Memory (GiB) are only supported for mixed instances groups configured with a set of instance attributes. A dropdown menu shows 'Units (number of instances)'.
- Desired capacity**: Specify your group size. A text input field contains the value '2'.
- Scaling** (Info icon): You can resize your Auto Scaling group manually or automatically to meet changes in demand.
- Scaling limits** (Info icon): Set limits on how much your desired capacity can be increased or decreased.
- Min desired capacity**: A text input field contains the value '1'. Below it, the text 'Equal or less than desired capacity' is displayed.
- Max desired capacity**: A text input field contains the value '4'. Below it, the text 'Equal or greater than desired capacity' is displayed.
- Automatic scaling - optional** (Info icon): Choose whether to use a target tracking policy. Below this, there are two radio buttons: 'No scaling policies' (selected) and 'Target tracking scaling policy'.

Step 3.3: Review and Create ASG

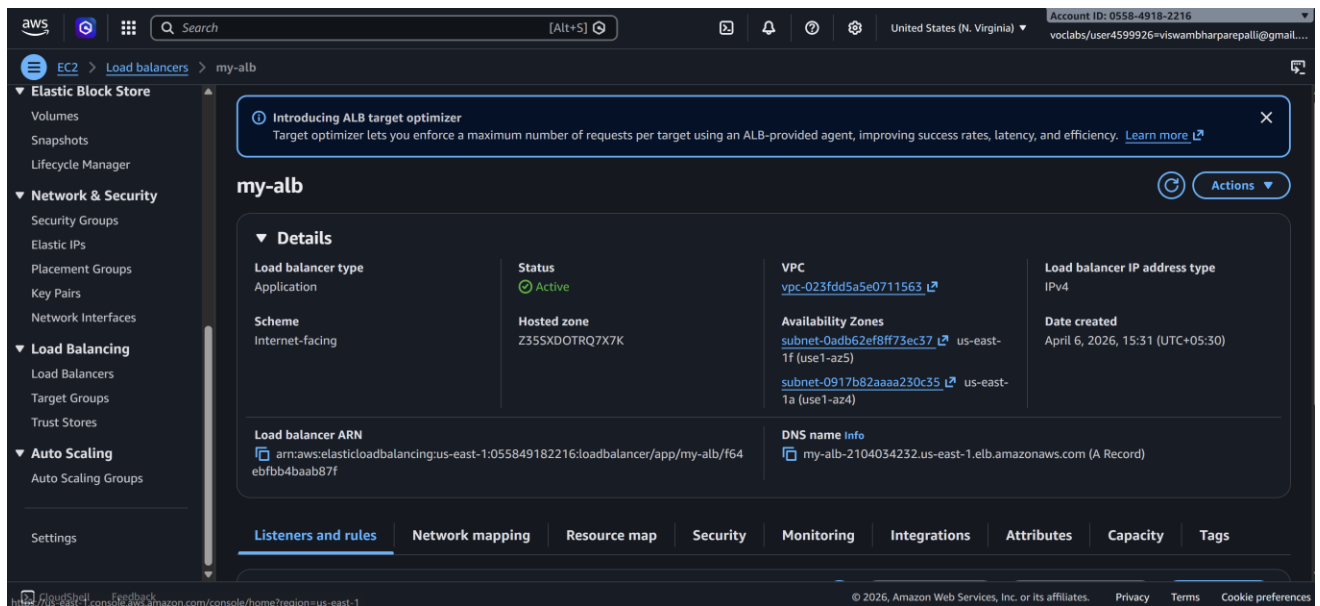

1. Review all settings
2. Click **Create Auto Scaling Group**

✓ Auto Scaling Group is now ready and attached to your Load Balancer.

Step 4: Verify Load Balancer and Auto Scaling

1. Go to **Load Balancers** → **Select your Load Balancer**

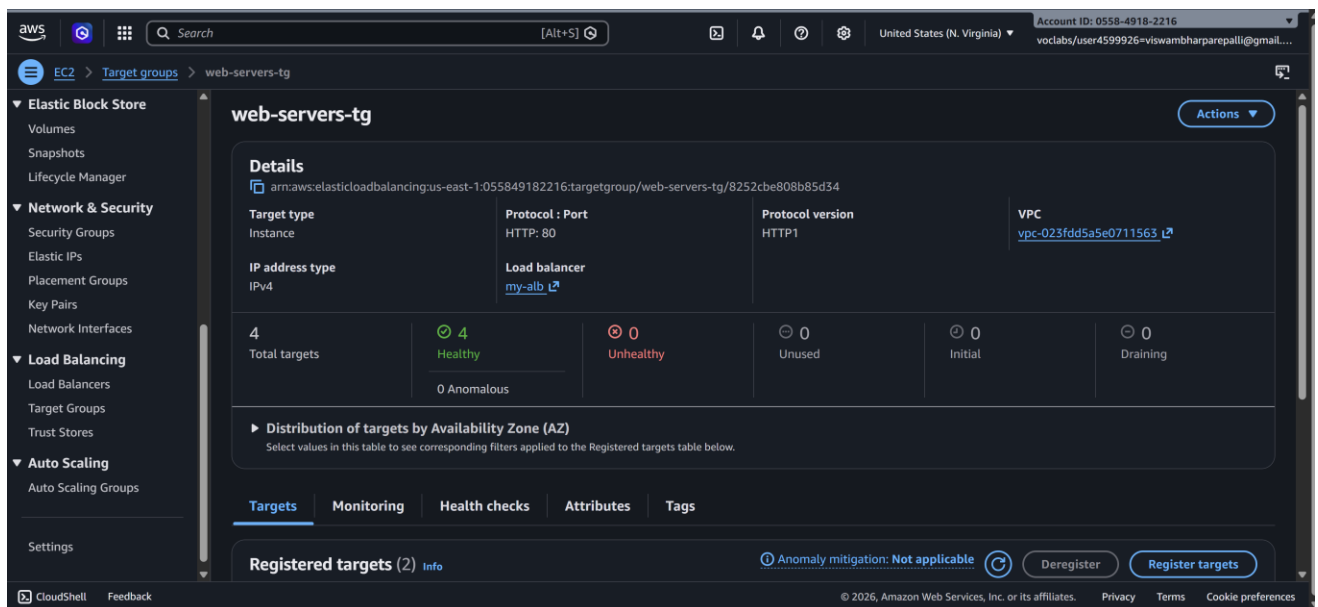

2. Click **Instances** → **Target Group** → **Registered Targets**
 - You will see **2 healthy instances** initially

4. Check Auto Scaling Group → Instances

- You may see up to 4 instances if scaling triggers

5. Test auto recovery:

- Terminate one of the instances

- After a few seconds, ASG will launch a new instance automatically

- Traffic will automatically be **distributed by the Load Balancer**

Step 5: Test the Load Balancer

1. Copy the **Load Balancer DNS Name** from ALB
2. Open in a browser → You should see your web page from one of the instances
3. Refresh multiple times → traffic alternates between instances

✓ This confirms **Auto Scaling + Load Balancer** is working correctly.

Summary of Flow

1. **Create AMI** → snapshot of working EC2
2. **Create Launch Template** → using AMI, security group
3. **Create Auto Scaling Group** → attach Launch Template, set min/desired/max, attach Load Balancer

4. **Verify instances** → ASG launches/replaces instances automatically
 5. **Test Load Balancer** → distributes traffic between all active instances
-

Scenario Based Questions (ELB & Auto Scaling)

1) A company hosts a web application on two EC2 instances, but sometimes one server becomes overloaded while the other remains idle. Which AWS service can distribute incoming traffic evenly across both servers?

A: Elastic Load Balancer (ELB) — It distributes incoming traffic evenly across multiple EC2 instances to prevent overloading and improve performance.

2) A developer created multiple EC2 instances for a web application but wants users to access the application using a single entry point instead of multiple server IP addresses. Which AWS service can solve this problem?

A: Elastic Load Balancer (ELB) — It provides a single DNS endpoint through which users can access multiple EC2 instances.

3) An organization notices that during peak hours their application receives heavy traffic and servers become slow. During non-peak hours, many servers remain unused. Which AWS feature can automatically increase or decrease the number of servers based on demand?

A: Auto Scaling — It automatically adjusts the number of EC2 instances based on traffic demand, improving efficiency and reducing cost.

4) A company deployed a load balancer but users are still getting errors because traffic is being sent to an unhealthy server. Which load balancer feature helps detect and stop sending traffic to failed servers?

A: Health Checks — They monitor instance health and ensure traffic is only routed to healthy servers.

5) A developer wants to automatically launch additional EC2 instances when CPU utilization exceeds 70%. Which AWS service configuration should be used to implement this requirement?

A: Auto Scaling Group with scaling policies — It uses CloudWatch metrics to trigger instance launch when CPU usage crosses the threshold.

6) An application receives traffic from users worldwide, and the company wants to ensure that requests are distributed across multiple EC2 instances for high availability. How can Elastic Load Balancer help in this architecture?

A: Elastic Load Balancer distributes traffic across multiple instances (and Availability Zones), ensuring high availability and fault tolerance.

7) A developer configured an Auto Scaling Group, but new instances are not launching even when traffic increases. What configuration might be missing or incorrect?

A: Scaling policy or CloudWatch alarm may be missing or misconfigured, so scaling actions are not triggered.

8) A company wants to maintain a minimum of two running servers at all times, but automatically add more servers when traffic increases. Which Auto Scaling configuration parameters should be defined?

A: Minimum capacity, desired capacity, maximum capacity, and scaling policies — These ensure baseline availability and dynamic scaling.

9) A web application running on EC2 instances behind a load balancer suddenly crashes when traffic spikes. How can combining Elastic Load Balancer with Auto Scaling improve system reliability?

A: ELB distributes traffic while Auto Scaling adds/removes instances based on demand, ensuring high availability and preventing overload.

10) A developer created an Auto Scaling Group but forgot to attach it to a load balancer. What potential problem might occur in handling user requests?

A: There will be no single entry point and traffic will not be evenly distributed, leading to poor performance and accessibility issues.

11) A company wants to replace unhealthy EC2 instances automatically to maintain application availability. Which AWS feature can automatically detect and replace failed instances?

A: Auto Scaling Group with health checks — It detects unhealthy instances and replaces them automatically.

12) A developer wants to monitor the performance of EC2 instances and trigger scaling actions based on metrics such as CPU usage or network traffic. Which AWS service can provide these monitoring metrics?

A: Amazon CloudWatch — It monitors metrics and triggers alarms for scaling actions.

13) A startup expects sudden spikes in website traffic during a promotional event and wants the infrastructure to automatically handle the load. How can Auto Scaling help manage this situation?

A: Auto Scaling automatically increases instances during high demand and decreases them during low demand, ensuring performance and cost efficiency.

14) A developer wants to ensure that incoming user requests are routed to servers based on HTTP or HTTPS protocols. Which type of AWS load balancer should be used?

A: Application Load Balancer (ALB) — It routes traffic based on HTTP/HTTPS at the application layer.

15) A company wants to build a highly available architecture where traffic is automatically balanced across multiple servers and new servers are launched when demand increases. Which AWS services should be combined to achieve this solution?

A: Elastic Load Balancer (ELB) with Auto Scaling — Together they provide load distribution and automatic scaling for high availability.
